+ 2.13 warcraft 3 map chrooting diezilla.com/project/brutal-chrooting- segmenting-2-pieces-into-one- with-flash- is it worth it? A: First, let's clear up some misconceptions: You don't have to "hack" the Flash file -- it doesn't exist. You're just installing and running an extension. If it works without a hack, you won't need a hack. A hack is generally a way to replace files. That is what chroots are for -- preventing the application from seeing files on a different partition. All file modification methods are "hacky". This is especially true for any file modification that's outside of the application's normal sandboxing or developer's sandboxing (like a patch). That's a hack. The "patch" is a hack. The "hack" is a hack. A binary file from a game installer is generally a hack. Most game "extensions" are a hack. Now, the correct answer is "it depends". There's no way to test this in a non-hacked version of Flash. If you're going to play the game with no hacks, no tricks, no third-party software, no third-party tools, and no hacks, then no, there is no reason to bother. You'll have to choose between a minor reduction in performance and not being able to play the game. If you are doing this because you have too much time on your hands, or don't like the developer of the game, or want to make the game play just a little bit better, then you can do this: Find a patched version of Flash. Modify Flash in some way (or find a hack that modifies Flash) so that it can access files on other partitions. Perform whatever modifications you want. There are no really easy ways 82157476af
